TITLE: The influence of natural organosulfur compounds on the stability of low viscosity oil from Tuymazy crudes

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 4, 1962, 483, abstract 4M191 (Sb. "Khimiya seraorgan. soyedineniy, soderzhashchikhsya v neftyakh i nefteproduktakh. v. 4". M., Gostoptekhizdat, 1961, 189-193)

TEXT: In experiments carried out in connection with a study of the stability of low S deep refined transformer oil from Tuymazy crude, and also of the detarred part of this oil before and after removal of the S-compounds, the natural S-containing organic compounds were found to have a positive effect on the stability of the oil with regard to oxidation. The S-compounds appear to play a particularly positive role as oxidation inhibitors for oil consisting of naphthenic and monocyclic aromatic hydrocarbons. When the cyclicity of the aromatics contained in the oil is increased, the inhibiting effect of the S-compounds is maintained.

21M146 (Novosti neft. i gaz. tekhn. Neftepererabotka i
neftekhimiya, no. 1, 1962, 9-13)

TEXT: Extracts obtained in the solvent refining of transformer distillates yield a sulfurous fraction containing sulfides. It has been shown that this fraction can be effective as an antioxidant for phenol-refined transformer oils. Some individual sulfur compounds were tested: cyclohexyl decyl sulfide and decyl thiophane were found to be efficient inhibitors. Furfural-refined oils were found to contain the largest proportion of the sulfide sulfur (62-65% of the total sulfur content), which appears to be one of the main factors of stability to oxidation of these oils. When the sulfurous crude petroleum is used to prepare the

TITLE: Study of fractions of sulfur compounds from the 300-400C distillate of Tuymazy petroleum

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 5, 1963, 26-31

TOPIC TAGS: sulfur compounds, 300-400C distillate, Tuymazy petroleum, sulfide, benzo-thiophenes, thiophenes, oxidation stability, transformer O.I., oxidation inhibitors, chromatography

ABSTRACT: Fractions of sulfur compounds were separated from extracts obtained in purifying distillate with phenol in the Novo-Ufimskiy NPZ. The extracts were dewaxed and resolved by chromatography on silica gel and aluminum oxide. Sulfides were separated from other sulfur compounds by oxidation with hydrogen peroxide. The narrow fractions obtained contained up to 10% S and had molecular weights in the range 230-260. Their physical and chemical properties indicate that the distillate studied contains benzo-thiophenes and thiophanes. The fractions isolated including sulfoxides were compared with synthetic sulfides and thiophenes in their effect on the oxidation stability of transformer O.I. Both natural and synthetic

AUTHOR: Krol', B. B.; Rozhdestvenskaya, A. A.; Kucheryavaya, N. N.

TITLE: Investigation of sulfur compounds contained in transformer oils.

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 5, 1964, 39-43

TOPIC TAGS: transformer oil, sulfur, sulfur containing compound, analysis, phenolic purification, chromatographic analysis, bithiocyclane, trithiocyclane, monocyclic sulfide, aliphatic sulfide, substituted alkylthiophane, benzothiophene derivative, bithionaphthene, trithionaphthene

ABSTRACT: The sulfur compounds in transformer oils obtained from Novo-Ufimsk NPZ sulfurous petroleums after phenolic purification were chromatographically adsorbed and partially identified. About 20-25% of the sulfurous compounds and about 33% of the antioxidant-imparting sulfides remain in the oil after phenolic purification. These were concentrated by adsorption on silica gel and alumina and oxidized collectively with H_2O_2 in acetic acid. The physical-chemical properties of the sulfurous components indicated they were bithiocyclanes and mixtures of bi- and trithiocyclanes. No monocyclic or aliphatic sulfides nor tri- or tetra-

Cord 1/2

ACCESSION NR: AP4036980

substituted alkylthiophanes were found. In addition to the bi- and tricyclic sulfides there were also some unsaturated sulfur compounds--derivatives of benzothiophenes--which could not be separated because of their close properties to the aromatic hydrocarbons. "G. A. Savitskaya participated in the experimental work." Orig. art. has: 4 tables.

ABSTRACT:

The author sums up the report she read on 22 May, 1958 in the Hydrogeological Section of the Society. She studied the chemical composition of pore solutions, formed by the action of atmospheric water on coal-bearing layers, washing away soluble salts. She found that solutions of that type are of chloride-calcium type in the Vereya argiles of the Middle Carboniferous period, which shows that solutions of this type are metamorphized water of marine sedimentation.

TITLE: Device for investigating fundus oculi in infrared light. Class 42,
No. 170182

SOURCE: Byulleten' izobretens i tovarnykh znakov, no. 8, 1963, 57

TOPIC TAGS: eyeball, fundus oculi, infrared light

ABSTRACT: A device for investigating the fundus oculi in infrared light consists
of an illuminating part which contains the light source, a condenser, and a system
of prisms or mirrors to alter the path of the light rays (see Fig. 1 of the Enclo-
sure). An ophthalmoscopic lens is used to separate the path of the incident light
from the path of the reflected light. To investigate the fundus oculi, an infrared
filter, which cuts down the visible spectrum to 760 nm, is introduced into the il-
luminating system. The viewing system contains an electron-optical converter to
produce a visible image of the fundus oculi and an eyepiece to observe this image.

TITLE: Automation of processing of oscillograms produced during ship tests

SOURCE: IVUZ. Priborostroyeniye, v. 9, no. 4, 1966, 61-66

TOPIC TAGS: automation, oscillogram processing, ship test

ABSTRACT: A semiautomatic apparatus for processing the oscillograms produced as a result of an actual ship test is described. The apparatus comprises a tape-transport mechanism, a scale-multiplying mechanism, two switches, and a counter-registering device. A principal scheme of the apparatus is explained. The apparatus, claimed to be simple, reliable, and inexpensive, aids in

Card 1/2

L 10464-67

ACC NR: AP6031040

constructing the integral curves of probability of exceeding a selected value of the parameter in question (list, trim, yawing, and their angular velocities); as a rule, these parameters are stationary random processes. As the oscillogram tape travels, the repetition frequency of each combination of half-periods and amplitudes is recorded by counters whose readings provide a basis for plotting the above probability curves. Orig. art. has: 4 figures, 1 formula, and 1 table.

In view of increasing use of coal, both brown and hard, containing large quantities of fines it is recommended to change over ~~over~~ existing installations to the unit-type pulveriser-furnace.

103. CHEMICALLY STABLE GLASS FOR GAUGES IN ASSES OF HIGH PRESSURE BOILERS,
Lopatinin O.K., Ioffe, G.Ya., Krol, L.R. and Tsvetkov, R.V. (Dokl. SSSR (Pur
St.), Moscow), July 1955, 19-217. Laboratory tests on glasses are described.
A glass composed of 3 parts sodium monoxide, 1.8 to 2 parts zirconia and 11.2 to
11 parts silicon when heated in water and steam at 250 to 320°C acquired a
transparent coating which was more stable than the glass. A production version,
Ts-21 glass, contains 32.5% silicon, 21.0% zirconia, 14.0% sodium monoxide and
2.5% potassium monoxide. It is being tested in high pressure boilers as a
substitute for silex. It has lasted on the average 60 days at 65 atm and 16
days at 125 atm. (L).

Electric Power Stations

"Certain Data on the Operation of High-Pressure
Boilers, With Natural Circulation, at USSR
Electric Power Stations," L. B. Krol', Cand
Tech Sci, 8 pp

"Elek Stants" No 10

High-pressure boilers installed in electric
power stations have widely different thermal
properties and internal boiler design. Their
ratings range from 40 to 230 tons/hr, 65 to 140
at and 470 to 510° C. Variance in type and

USSR/Engineering - Boilers, High Pressure Oct 49

(Contd)

quality of Soviet fuels presents certain diffi-
culties, particularly evident when foreign-make
boilers are used. Author describes some of
these problems in detail, pointing out need for
further research on circulation, separation, and
multistage evaporation. Expresses opinion that
Soviet high-pressure boilers produced by Taganrog
"Krasny Kotel'shchik" Plant (230 tons/hr, 100
st., 510° C) are more reliable and economical
than foreign makes. Devotes separate sections
to analysis of economic indexes, fuels, circula-
tion, steam superheaters, regulation of super-
heat, water conditions, etc.

Iz V-S Teplotekh Inst, No 10, pp 11-16

Experimentally establishes expediency of designing high-pressure boilers with radiant-convection superheater with its radiant part of wall-type construction. Suggests as most efficient design, that in which steam from boiler drum is directed first into radiant portion of superheater and subsequently into its convection section where thermal stresses of heating surface are considerably lower than in furnace. Cr-Mo steel is suggested as material for superheaters.

✓ 5393. METHOD FOR INCREASING STEAMING CONTROL IN HIGH PRESSURE
BOILERS. Krol, L.P. and Lezhabin, V.A. (Electr. Sta. (Power Sta., Moscow),
Geo. 1924, Vol. 25, 11-17). Existing Russian high pressure boilers with
superheaters and superheat regulators operate on a highly inert system
which does not lend itself to automatic control. It is suggested that they
be equipped with radiation/convection superheaters with regulation by spray
in series. In new boilers with convection superheaters, superheat should
be carried out in a two-stage plan with surface condensers in the first
stage and spray in the second. In existing boilers with convection
condensers on the saturated steam side the superheat control system can
be substantially improved by the second stage arrangement - spraying in
series. For the spray, the high pressure preheater condensate together
with power turbine condensate may be used.

Title : Reduction of temperature of outgoing flue-
gas with the help of an improved design of the
boiler

Periodical : Elek. Sta., 2, 4-8, F 1955

Abstract : The authors consider that at present the
temperature of flue-gases is, as a rule, too
high, and thus does not correspond to existing
technical possibilities. The increase and
improvement of the convection surfaces, and the
use of low-pressure steam-economisers and of
heat-salvaging boilers can, in certain cases,
contribute to the efficiency of power plant
cycles. This applies in particular to plants
burning fuels containing moisture and sulfurous.

TITLE: Cyclon Furnaces in German Boilers
(Tsiklonnyye topki v germanskikh kotloagregatakh)

PERIODICAL: Energokh-vo za rubezhom, 1956, Nr 5, pp 17-20

ABSTRACT: Data is presented on 38 boilers built or ordered in West Germany prior to May, 1955, with a total steam capacity of 5133 t/h, and whose furnaces are equipped with horizontal or slightly inclined cyclons and with a tangential inlet for the pulverized coal and air. The maximum boiler steam capacity of 320 t/h corresponds to three cyclons. Most boilers operate on anthracite, a few of them on brown coal. The degree of ash trapping in the furnace is 80%. Finest friable ash deposits have been observed in steam superheaters and on subsequent heating surfaces, particularly with complete fuel combustion. Contamination is controlled by soot blowers, shaking devices, and a metal-ball "rain." Cyclon-type furnaces operate with higher blowing pressure (800-

Card 1/2

SOV/112-58-1-165

Cyclon Furnaces in German Boilers

1,100 mm of water), but the energy consumption by boiler auxiliaries is comparable to that for conventional pulverized-coal furnaces. With the load as low as 1/3 of the full rated load, slag still flows out of the furnace.
